Python code for determining Eigenvalues:

```
import numpy as np

import matplotlib.pyplot as plt
from numpy.linalg import eig
from scipy.io import loadmat

if __name__ == '__main__':
    data = loadmat('teapots.mat')
    X = data['teapotImages']
    u = np.mean(X, axis=0).reshape(1,1900)
    x = X - np.repeat(u,100,axis=0)
    C = x.T.dot(x) / (x.shape[0]-1)
    D, V = eig(C)
    print(x.shape)
    print(C)
    print(D[:3])
    print(V[:, :3])
```

Writeup:

① We use PCA on image data provided to reconstruct it. We determine top 3 most significant components of image data, encode them with mean of the data for reconstruction.

First, compute mean of image data of shape (100, 100) using `np.mean`. Then minus the mean from all data points to get decentered values.

$$\mu = \text{mean}(X)$$
$$x = X - \mu$$

Mean of image data is shown as follows

Then, find covariance matrix of data of shape
(100, 1900)

$$C = \text{cov}(x) = x^T x \quad \text{which has dim (1900, 1900)}$$

Apply Eigenvalue decomposition to covariance matrix
to find

V = Eigenvalue matrix

~~A~~ Matrix with eigenvalue on the diagonal Λ

$$C = V \Lambda V^{-1}$$

→ Determine most significant value in eigenvalues

As cov matrix is symmetric and positive-definite,
eigenvalues are all non-negative.

Top 3 most significant eigenvalues are:

[4.2150, 3.0168, 2.0993]

each with corresponding eigenvector

Each eigenvector can be shown as an image, depicted
below

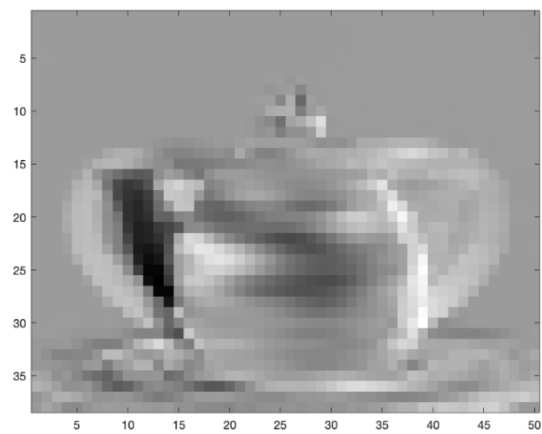

Eigen Value=4.2150

Eigen Value: 3.0168

Eigen Value: 2.0993

→ Encode by calculating coefficient matrix

$$\text{Coeff matrix } (c_{ij}) = (X_i - \mu)^T V'_j = x_i^T V'_j,$$

is inner product of x and top-3 eigenvectors

$$C = XV'$$

Decode and construct new image \hat{x}

$$\hat{X}_i = \mu + \sum_{j=1}^3 c_{ij} V'_j$$

Reconstructs →

$$\hat{X} = \mu + CV'$$

Picked images randomly $i = 10-20$
to reconstruct using TCA. Following are results

Before Recon

After Recon

Before Recon

After Recon

Before Recon

After Recon

Before Recon

After Recon

Before Recon

After Recon

Before Recon

After Recon

Before Recon

After Recon

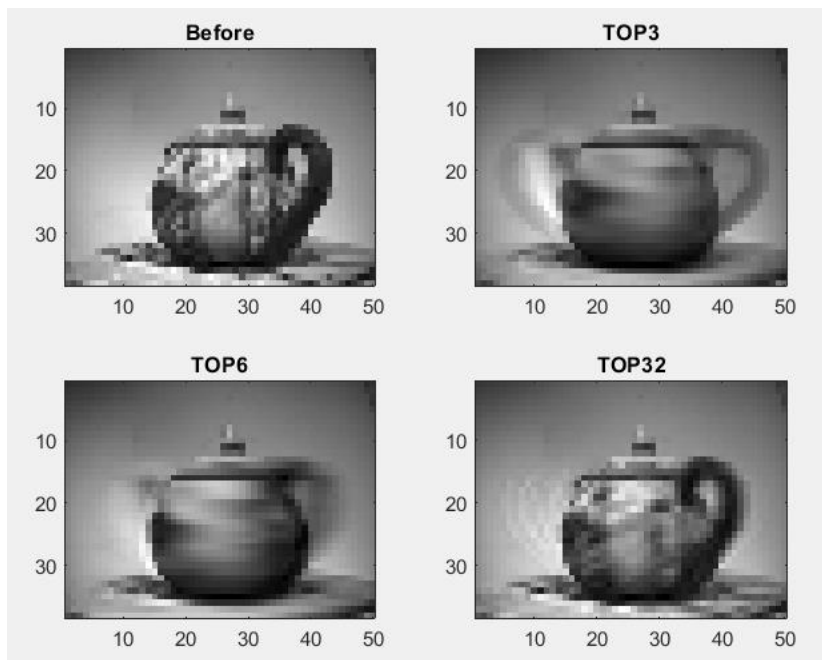

As observed, some images are well reconstructed and distinguishable but many others appear to be not that well reconstructed. Only top 3 components are sharp/aggressive. As per Eigenvalue decomposition, 32 values are more than 0.1, and 6 values are higher than 1. Decoding with more components could get a better reconstruction.

Performance of PCA encoder is determined by computing L-2 norm of X and \hat{X} . The outcome number is 13.6262.

By picking top-6 components, norm value goes down to 9.8303; by picking top 6 component, norm reduces to 3.1382.

Following are snips of image data encode/decode with top 3, top 6 and top 32 most significant components.

Encoding more components into reconstruction gives better outcome with detailing. Deciding on how many most significant components we pick comes down to the requirements of the problem, item in question and how main feature is defined.

Ans 2:

1

V B 2182 HW 4

Box 1

8 apples, 4 oranges

Box 2

10 apples, 2 oranges

Apple selected \Rightarrow Probability of selecting a box

$$P(E_1) = P(E_2) = \frac{1}{2}$$

A: Selecting Apple from Box

$$P(A/E_1) = \frac{8}{12} = \frac{2}{3}; \quad P(A/E_2) = \frac{10}{12} = \frac{5}{6}$$

Applying Bayes' theorem

$$P(E_1/A) = \frac{P(E_1) P(A/E_1)}{P(E_1) P(A/E_1) + P(E_2) P(A/E_2)}$$
$$= \frac{\frac{1}{2} \times \frac{2}{3}}{\frac{1}{2} \times \frac{2}{3} + \frac{1}{2} \times \frac{5}{6}} = \frac{\frac{1}{3}}{\frac{1}{3} + \frac{5}{12}} = \frac{1}{1 + \frac{5}{4}} = \frac{4}{9}$$

Ans

Ans 3:

① Each class is Gaussian
 $\theta = \{\alpha, \mu_1, \Sigma_1, \mu_2, \Sigma_2\}$

Class probability via Bernoulli distribution

$$P(y|\theta) = \alpha^y (1-\alpha)^{1-y}$$

Probability of data $P(x|y, \theta) = \mathcal{N}(x|\mu_y, \Sigma_y)$.

Use max likelihood for α , μ 's and Σ 's.

$$\mu_{MLE} = \operatorname{argmax}_{\mu} \mathcal{N}$$

~~sol~~ Likelihood function $L = P(x|y, \theta) = \mathcal{N}(x|\mu_y, \Sigma_y)$

For, MLE of Gaussian model, we need to find good estimates of μ & Σ

$$\mu_{MLE} = \operatorname{argmax}_{\mu} \mathcal{N}(x|\mu_y, \Sigma_y)$$

$$\Sigma_{MLE} = \operatorname{argmax}_{\Sigma} \mathcal{N}(x|\mu_y, \Sigma_y)$$

We need to get best parameter θ for a Gaussian

$$\begin{aligned} \theta_{MLE} &= \operatorname{argmax}_{\theta} \log \\ &= \operatorname{argmax}_{\theta} \log(\mathcal{N}(x|y, \theta)) \\ &= \operatorname{argmax}_{\theta} \log(\mathcal{N}(x|y, \theta)) \end{aligned}$$

$$\sum_{n=1}^N \log(\mathcal{N}(x|y, \theta)) = \sum_{n=1}^N \log(\mathcal{N}(x|\mu_y, \Sigma_y))$$

Assume Gaussian have diagonal covariance matrices

Let full covariance matrix Σ gets replaced by a

diagonal variance vector σ^2

$$\sum_{n=1}^N \log(\mathcal{N}(x|y, \Sigma_y)) = \sum_{n=1}^N \log(\mathcal{N}(x|\mu_y, \sigma_y^2))$$

$$\Rightarrow \sum_{n=1}^N \log(\mathcal{N}(x/\mu_y, \sigma_y^2)) = \sum_{n=1}^N \log\left(\frac{1}{\sqrt{2\pi}\sigma_y} \exp^{-\frac{1}{2}\left(\frac{x_n - \mu_y}{\sigma_y}\right)^2}\right)$$

$$\text{log likelihood } \mathcal{L} = \sum_{n=1}^N \log\left(\frac{1}{\sqrt{2\pi}\sigma_y} \exp^{-\frac{1}{2}\left(\frac{x_n - \mu_y}{\sigma_y}\right)^2}\right)$$

$$= \sum_{n=1}^N \left(\log\left(\frac{1}{\sqrt{2\pi}\sigma_y}\right) + \log\left(\exp^{-\frac{1}{2}\left(\frac{x_n - \mu_y}{\sigma_y}\right)^2}\right) \right)$$

$$\Rightarrow \mathcal{L} = \sum_{n=1}^N \left(-\log(\sqrt{2\pi}\sigma_y) - \frac{1}{2} \left(\frac{x_n - \mu_y}{\sigma_y} \right)^2 \right)$$

$$= -\frac{1}{2} \sum_{n=1}^N \log(2\pi\sigma_y^2) + \sum_{n=1}^N \frac{1}{2} \frac{(x_n - \mu_y)^2}{\sigma_y^2}$$

$$\mathcal{L} = \left[-\frac{N}{2} \log(2\pi\sigma_y^2) - \frac{1}{2\sigma_y^2} \sum_{n=1}^N (x_n - \mu_y)^2 \right] \quad \text{--- (I)}$$

solve for μ_y & σ_y^2 one by one:

$$\frac{\partial \mathcal{L}}{\partial \mu_y} = 0 \text{ for } \text{argmax}_{\mu_y} \mathcal{L}(x/\mu_y, \sigma_y^2)$$

$$\Rightarrow \frac{\partial \mathcal{L}}{\partial \mu_y} = \frac{\partial}{\partial \mu_y} \left[-\frac{N}{2} \log(2\pi\sigma_y^2) \right] + \frac{\partial}{\partial \mu_y} \left[-\frac{1}{2\sigma_y^2} \sum_{n=1}^N (x_n - \mu_y)^2 \right]$$

$$= -\frac{1}{2\sigma_y^2} \sum_{n=1}^N \frac{\partial}{\partial \mu_y} (x_n - \mu_y)^2$$

$$= -\frac{1}{2\sigma_y^2} \times (-2) \sum_{n=1}^N (x_n - \mu_y) = 0$$

$$\Rightarrow \sum_{n=1}^N x_n - \sum_{n=1}^N \mu_y = 0$$

$$\sum_{n=1}^N x_n = N\mu_y$$

$$\Rightarrow \mu_y = \frac{1}{N} \sum_{n=1}^N x_n \quad \text{--- (II)}$$

MLE of σ^2

$$\frac{\partial LL}{\partial \sigma_y^2} = \frac{\partial}{\partial \sigma_y^2} \left(-\frac{N}{2} \log(2\pi\sigma_y^2) \right) + \frac{\partial}{\partial \sigma_y^2} \left(-\frac{1}{2\sigma_y^2} \sum_{n=1}^N (x_n - \mu_y)^2 \right)$$

$$= \frac{-N \times \frac{1}{2}}{2\pi\sigma_y^2} + \sum_{n=1}^N \frac{-1 \times (-1)}{2\sigma_y^2 \cdot \sigma_y^2} (x_n - \mu_y)^2$$

$$= \frac{-N}{2\sigma_y^2} + \frac{1}{2\sigma_y^4} \sum_{n=1}^N (x_n - \mu_y)^2 = 0$$

$$\Rightarrow \sigma_y^2 = \frac{1}{N} \sum_{n=1}^N (x_n - \mu_y)^2 \quad \text{--- (II)}$$

$$\Rightarrow \sigma_y = \left[\frac{\sum_{n=1}^N (x_n - \mu_y)^2}{N} \right]^{1/2} \quad \text{--- (III)}$$

now $p(y|\theta) = \alpha^y (1-\alpha)^{1-y}$; where $y=0, 1$
0; everywhere else

$$L(y|\theta) = \prod_{i=1}^N \alpha^{y_i} (1-\alpha)^{1-y_i}$$

$$\log L(y|\theta) = \sum_{i=1}^N \log \alpha^{y_i} + \log (1-\alpha)^{1-y_i}$$

$$LL(\theta) = \sum_{i=1}^N y_i \log \alpha + \sum_{i=1}^N (1-y_i) \log (1-\alpha)$$

$$= \log \alpha \sum_{i=1}^N y_i + (N - \sum_{i=1}^N y_i) \log (1-\alpha)$$

$$\frac{\partial LL(\theta)}{\partial \alpha} = \text{Let say } \sum_{i=1}^N y_i = Y$$

$$\Rightarrow LL(\theta) = Y \log \alpha + (N-Y) \log (1-\alpha) \quad \text{--- (IV)}$$

$$\frac{\partial LL(\hat{\alpha})}{\partial \alpha} = Y \times \frac{1}{\alpha} + \frac{(N-Y) \times (-1)}{1-\alpha} = 0$$

$$\Rightarrow \hat{\alpha} = \frac{Y}{N} = \frac{\sum_{i=1}^N y_i}{n} \quad \text{--- (V)}$$

Bayes Rule

Lecture

Probability

Use the decision boundary as eq of p vs n :
 $P(Y=1|X=n) = P(Y=0|X=n)$

For 2D Gaussian $N(\mu_y, \Sigma_y)$ class conditional feature distribution $P(X=n|Y=y)$

$$P(X=n|Y=y) = \frac{1}{\sqrt{(2\pi)^d |\Sigma_y|}} \exp\left(-\frac{(n-\mu_y)' \Sigma_y^{-1} (n-\mu_y)}{2}\right)$$

$$\frac{P(Y=1|X=n)}{P(Y=0|X=n)} = \frac{P(X=n|Y=1)P(Y=1)}{P(X=n|Y=0)P(Y=0)}$$

$$= \frac{\sqrt{|\Sigma_1|} \exp\left(-\frac{(n-\mu_1)' \Sigma_1^{-1} (n-\mu_1)}{2}\right)}{\sqrt{|\Sigma_2|} \exp\left(-\frac{(n-\mu_2)' \Sigma_2^{-1} (n-\mu_2)}{2}\right)} \frac{\theta}{1-\theta}$$

(VI) is a quadratic equation in n

But if $\Sigma_1 = \Sigma_2$, then quadratic part cancels out, and decision boundary becomes linear

\Rightarrow For $\Sigma_1 = \Sigma_2$, (VI) becomes

$$\frac{\theta}{1-\theta} = \frac{\exp\left(-\frac{(n-\mu_2)' \Sigma_1^{-1} (n-\mu_2)}{2}\right)}{\exp\left(-\frac{(n-\mu_1)' \Sigma_1^{-1} (n-\mu_1)}{2}\right)}$$

Σ_1^{-1} terms cancel

but leaving

maximum n defill

to be 1

$$= \exp\left[\frac{-x \Sigma_1^{-1} (x-\mu_2) + \mu_2}{2}\right]$$

③

$$\theta = \{\alpha, \mu_1, \mu_2, \Sigma_1, \Sigma_2\}$$

$$P(y|\theta) = \alpha^y (1-\alpha)^{1-y} ; P(x|y, \theta) = N(x|\mu_y, \Sigma_y)$$

Maximum likelihood estimator θ_{MLE}

$$L(\theta) = \prod_{i=1}^N P(x_i, y_i | \theta) = p(\text{data} | \theta)$$

$$\ell(\theta) = \log(L(\theta)) = \log(p(\text{data} | \theta)) = \sum_{i=1}^N \log(p(x_i, y_i | \theta))$$

$$= \sum_{i=1}^N \log p(y_i | \theta) + \sum_{i=1}^N \log p(x_i | y_i, \theta) \quad [\text{Bayes' rule}]$$

$$\ell(\theta) = \underbrace{\sum_{i=1}^N \log p(y_i | \alpha)}_{\text{part 1}} + \underbrace{\sum_{y_i \in 0} \log p(x_i | \mu_1, \Sigma_1)}_{\text{part 2}} + \underbrace{\sum_{y_i \in 1} \log p(x_i | \mu_2, \Sigma_2)}_{\text{part 3}}$$

part 1: $\sum_{i=1}^N \log p(y_i | \alpha) = \sum_{i=1}^N \log \alpha^{y_i} (1-\alpha)^{1-y_i} = \ell(\alpha)$

$$\frac{\partial \ell(\alpha)}{\partial \alpha} = 0 = \frac{\partial}{\partial \alpha} \left(\sum_{i=1}^N y_i \log \alpha + (1-y_i) \log(1-\alpha) \right) = 0$$

$$\frac{\partial}{\partial \alpha} \sum_{i=1}^N \log \alpha + \sum_{i \in 0} \log(1-\alpha) = 0 \Rightarrow \frac{N_1}{\alpha} - \frac{N_0}{1-\alpha} = 0$$

$$\alpha_{MLE} = \frac{N_1}{N_1 + N_0}$$

$$\vec{\mu}_1 = \mu_1 ; \vec{\mu}_2 = \mu_2$$

part 2: $\ell(\mu_1, \Sigma_1) = \sum_{y_i \in 0} \log(p(x_i | \mu_1, \Sigma_1))$

$$\ell(\mu_1, \Sigma_1) = \sum_{i=1}^N \log \frac{1}{(2\pi)^{D/2} \sqrt{|\Sigma_1|}} \exp \left(-\frac{1}{2} (\vec{x}_i - \vec{\mu}_1)^T \Sigma_1^{-1} (\vec{x}_i - \vec{\mu}_1) \right)$$

$$\frac{\partial \ell(\mu_1, \Sigma_1)}{\partial \mu_1} = \frac{\partial}{\partial \mu_1} \left(\sum_{i=1}^N -D/2 \log 2\pi - \frac{1}{2} \log |\Sigma_1| - \frac{1}{2} (\vec{x}_i - \vec{\mu}_1)^T \Sigma_1^{-1} (\vec{x}_i - \vec{\mu}_1) \right) = 0$$

$$\Rightarrow \sum_{i=1}^N (\vec{x}_i - \vec{\mu}_1)^T \Sigma_1^{-1} = 0 \Rightarrow \boxed{\mu_1 = \frac{1}{N_0} \sum_{y_i \in 0} \vec{x}_i}$$

$$\frac{\partial \ell(\mu_1, \Sigma_1)}{\partial \Sigma_1} = 0 = \frac{\partial}{\partial \Sigma_1} \left(\sum_{i=1}^N -\frac{D}{2} \log 2\pi - \frac{1}{2} \log |\Sigma_1| - \frac{1}{2} (\vec{x}_i - \vec{\mu}_1)^T \Sigma_1^{-1} (\vec{x}_i - \vec{\mu}_1) \right)$$

= 0 EQ1

$$\text{Say } A_1 = \Sigma_1^{-1}$$

$$\frac{\partial}{\partial A_1} \left(-\frac{N}{2} D \log 2\pi + \frac{N}{2} \log |A_1| - \frac{1}{2} \sum_{i=1}^N \frac{1}{y_i} \text{tr}(EQ1) \right) = 0$$

$$\frac{\partial \log |A|}{\partial A} = (A^{-1})^T \quad \left| \quad \frac{\partial \text{tr}(BA)}{\partial A} = B^T \right.$$

Equation FIRST

$$\left\{ \text{Applying } x x^T A = \text{tr}(x^T A x) = x^T A x \right\}$$

$$\frac{\partial}{\partial A_1} \left(-\frac{N}{2} D \log 2\pi + \frac{N}{2} \log |A_1| - \frac{1}{2} \sum_{i=1}^N \text{tr} \left[(\vec{x}_i - \vec{\mu}_1) (\vec{x}_i - \vec{\mu}_1)^T A_1 \right] \right) = 0$$

$$\frac{\partial \ell(\mu_1, \Sigma_1)}{\partial A_1} = 0 \Rightarrow -0 + \frac{N}{2} (A_1^{-1})^T - \frac{1}{2} \sum_{i=1}^N \left[(\vec{x}_i - \vec{\mu}_1) (\vec{x}_i - \vec{\mu}_1)^T \right]^T = 0$$

$$\Rightarrow \frac{N}{2} \Sigma_1^{-1} - \frac{1}{2} \sum_{i=1}^N (\vec{x}_i - \vec{\mu}_1) (\vec{x}_i - \vec{\mu}_1)^T = 0$$

$$\Rightarrow \Sigma_1^{-1} = \frac{1}{N} \sum_{i=1}^N (\vec{x}_i - \vec{\mu}_1) (\vec{x}_i - \vec{\mu}_1)^T$$

Also, in a similar way,

$$\Sigma_2 = \frac{1}{N_1} \sum_{i \in 1} (\vec{x}_i - \vec{\mu}_2) (\vec{x}_i - \vec{\mu}_2)^T$$

$$\mu_2 = \frac{1}{N_1} \sum_{i \in 1} x_i$$

Bayes' Optimal decision

$$\hat{y} = \underset{y \in \{0, 1\}}{\text{argmax}} h(y|x) \text{ which is } \hat{y} = 0.5 \text{ as decision boundary}$$

$$h(y|x) = \frac{h(x, y)}{h(x)} = \frac{h(x, y)}{\sum_y h(x, y)} = \frac{p(x, y)}{p(x, y=0) + p(x, y=1)}$$

$$h(y=1|x) = \frac{h(x, y=1)}{h(x, y=0) + h(x, y=1)} = \frac{1}{2} N(x | \mu_2, \Sigma_2)$$

$$(1-\alpha)N(x|\mu_1, \Sigma_1) + \alpha N(x|\mu_2, \Sigma_2)$$

Case 1st: $\Sigma_1 = \Sigma_2 = \Sigma$

$$h(y=1|x) = h = 0.5 = \alpha \cdot N(x|\mu_2, \Sigma) \xrightarrow{N_2^*}$$

$$(1-\alpha)N(x|\mu_1, \Sigma) + \alpha N(x|\mu_2, \Sigma)$$

$$\xrightarrow{N_1^*} \left(\frac{1-\alpha}{2}\right)N_1^* + \frac{\alpha}{2}N_2^* = \alpha N_2^*$$

$$(1-\alpha)N_1^* = \alpha N_2^*$$

$$\Rightarrow \log(1-\alpha) + \log N_1^* = \log \alpha + \log N_2^*$$

Assume $\log(1-\alpha) = c_1$ and $\log \alpha = c_2$; $c_1 - c_2 = c$

$$\Rightarrow c + \log\left(\frac{1}{2\pi^{D/2}\sqrt{|\Sigma|}}\right) - \frac{1}{2}\sum_{i=1}^D (\vec{x}_i - \mu_1)^T \Sigma^{-1} (\vec{x}_i - \mu_1)$$

$$= \log\left(\frac{1}{2\pi^{D/2}\sqrt{|\Sigma|}}\right) - \frac{1}{2}\sum_{i=1}^D (\vec{x}_i - \mu_2)^T \Sigma^{-1} (\vec{x}_i - \mu_2)$$

$$\Rightarrow c = \frac{1}{2}\sum_{i=1}^D \left((\vec{x}_i - \mu_1)^T \Sigma^{-1} (\vec{x}_i - \mu_1) - (\vec{x}_i - \mu_2)^T \Sigma^{-1} (\vec{x}_i - \mu_2) \right)$$

Apply trace formula

$$\Rightarrow c = \frac{1}{2}\sum_{i=1}^D \text{tr} \left((\vec{x}_i - \mu_1)(\vec{x}_i - \mu_1)^T - (\vec{x}_i - \mu_2)(\vec{x}_i - \mu_2)^T \right) \Sigma^{-1}$$

$$\Rightarrow c = \frac{1}{2}\sum_{i=1}^D \text{tr} \left((2(\mu_2 - \mu_1)(\mu_2 - \mu_1)^T + \mu_1^2 - \mu_2^2) \Sigma^{-1} \right) \quad \text{(linear eq in } \mu\text{)}$$

Case 2nd, when $\Sigma_1 \neq \Sigma_2$ then $x_i x_i^T$ will have $\Sigma_1 \Delta \Sigma_2$

coefficients, which won't cancel each other.

So, the final equation is quadratic in terms of x_i in decision boundary.

\Rightarrow When covariances are equal, distribution of both the ^L classes is similar and as a result, they can be linearly dissected.

When covariances are unequal, one class dominates the other, has a wider distribution, while the other has a more compact distribution.

If covariances are different, quadratic decision boundary

Linear decision example

Data classes $\{x, \cdot\}$ have same covariances (uniform distribution) and hence have linear decision boundary
